모델 학습을 위한 데이터 전처리

- 데이터 로드

```python
def load_dataset(self, dataset_id, tokenizer):
    def tokenization(examples):
        sources = []
        targets = []
        prompt = self.PROMPT_TEMPLATE
        for instruction, input, output in zip(examples['instruction'],examples['input'],examples['output']):
            if input is not None and input !="":
                instruction = instruction+'\n'+input
            source = prompt.format_map({'instruction':instruction})
            target = f"{output}{tokenizer.eos_token}"

            sources.append(source)
            targets.append(target)

        tokenized_sources = tokenizer(sources,return_attention_mask=False)
        tokenized_targets = tokenizer(targets,return_attention_mask=False,add_special_tokens=False)

        all_input_ids = []
        all_labels = []
        for s,t in zip(tokenized_sources['input_ids'],tokenized_targets['input_ids']):
            input_ids = torch.LongTensor(s + t)[:self.MAX_SEQ_LEN]
            labels = torch.LongTensor([-100] * len(s) + t)[:self.MAX_SEQ_LEN]
            assert len(input_ids) == len(labels)
            all_input_ids.append(input_ids)
            all_labels.append(labels)

        results = {'input_ids':all_input_ids, 'labels': all_labels}
        return results

    all_datasets = []

    raw_dataset = load_dataset(dataset_id)
    tokenization_func = tokenization
```

- 토큰화

```python
def load_dataset(self, dataset_id, tokenizer):
    def tokenization(examples):
        sources = []
        targets = []
        prompt = self.PROMPT_TEMPLATE
        for instruction, input, output in zip(examples['instruction'],examples['input'],examples['output']):
            if input is not None and input !="":
                instruction = instruction+'\n'+input
            source = prompt.format_map({'instruction':instruction})
            target = f"{output}{tokenizer.eos_token}"

            sources.append(source)
            targets.append(target)

        tokenized_sources = tokenizer(sources,return_attention_mask=False)
        tokenized_targets = tokenizer(targets,return_attention_mask=False,add_special_tokens=False)

        all_input_ids = []
        all_labels = []
        for s,t in zip(tokenized_sources['input_ids'],tokenized_targets['input_ids']):
            input_ids = torch.LongTensor(s + t)[:self.MAX_SEQ_LEN]
            labels = torch.LongTensor([-100] * len(s) + t)[:self.MAX_SEQ_LEN]
            assert len(input_ids) == len(labels)
            all_input_ids.append(input_ids)
            all_labels.append(labels)

        results = {'input_ids':all_input_ids, 'labels': all_labels}
        return results

    all_datasets = []

    raw_dataset = load_dataset(dataset_id)
    tokenization_func = tokenization
```

모델 학습을 위한 데이터 전처리

- 배치 및 Collator

```python
from dataclasses import dataclass
from typing import Dict, Sequence

import torch
import transformers

@dataclass
class DataCollatorForSupervisedDataset:
    tokenizer: transformers.PreTrainedTokenizer

    def __call__(self, instances: Sequence[Dict]) -> Dict[str, torch.Tensor]:
        input_ids, labels = tuple(
            [instance[key] for instance in instances] for key in ("input_ids", "labels")
        )
        input_ids = torch.nn.utils.rnn.pad_sequence(
            input_ids, batch_first=True, padding_value=self.tokenizer.pad_token_id
        )
        labels = torch.nn.utils.rnn.pad_sequence(
            labels, batch_first=True, padding_value=-100
        )
        return dict(
            input_ids=input_ids,
            labels=labels,
            attention_mask=input_ids.ne(self.tokenizer.pad_token_id),
        )
```

- 자동화 생성

```python
            raw_dataset = load_dataset(dataset_id)
            tokenization_func = tokenization
            tokenized_dataset = raw_dataset.map(
                tokenization_func,
                batched=True,
                remove_columns=["instruction","input","output"],
                keep_in_memory=False,
                desc="preprocessing on dataset",
            )
            processed_dataset = tokenized_dataset
            processed_dataset.set_format('torch')
            all_datasets.append(processed_dataset['train'])
            all_datasets = concatenate_datasets(all_datasets)
            return all_datasets

    def get_data_collator(self, tokenizer):
        collator = DataCollatorForSupervisedDataset(tokenizer)
        return collator
```
